

Vulnerability Management.

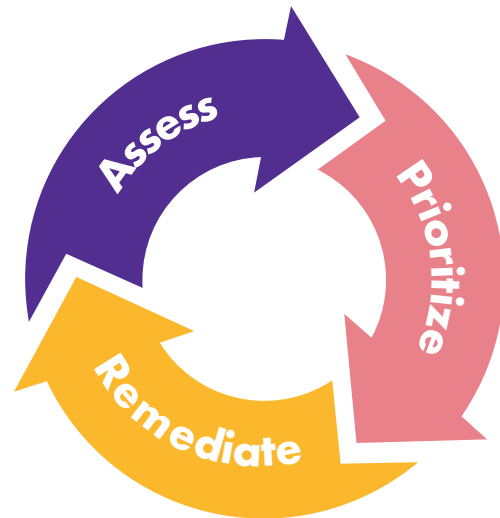

- Manage vulnerabilities proactively
- Scan and assess your entire IT ecosystem
- Prioritize risks for remediation
- Strengthen resistance to attacks

Leapfrog Vulnerability Management is part of our Visibility Program and is included in the Leapfrog Premium Security Package.

You can't remediate vulnerabilities if you don't know where they are.

Leapfrog's Vulnerability Management program identifies and remediates gaps and defects in your security posture before bad actors can exploit them. Our Security Operation Center (SOC) engineers use specialized tools to scan your systems regularly and then take action based on the CVSS scoring system that evaluates and ranks vulnerabilities in a standardized and repeatable way.

- Comprehensive, proactive, and hands-on
- Cloud-based, always-on technology
- Accurate, efficient, scalable
- Alerts for critical vulnerabilities
- Custom reporting options
- Secure audit trails
- Fewer SIEM events to mitigate

Managed VM goes beyond patch management.

Leapfrog's Vulnerability Management is far more advanced than software and systems patching — it keeps up with lightning-fast changes in the technology landscape. By identifying new vulnerabilities as they emerge, Leapfrog can mitigate new potential threats, whether or not patches are available. What's more, anything connected to your environment can be scanned, from printers to IoT devices to fire alarms.

If you're ready for secure IT that keeps pace with your business strategy, **Leapfrog is ready to help. Let's talk.**
